## More than 60 years committed to innovation

GRACCO is a project undertaken by CerameX, a prestigious company boasting more than 60 years of experience in the Construction sector.

Adapting to the changes that have occurred in this industry, the demands that have been affecting the Spanish market, and always using the most modern industrial machinery technologies, the main objective has been to offer new solutions and innovative developments that successfully respond to the market's most stringent demands, always maintaining an intense operational pace.

Transformation and Resilience are two terms that define our company's philosophy, which is based on people, because they are what make projects possible.

After years of research and development, in collaboration with the Polytechnic University of Madrid we have carried out an innovative project, funded by the Ministry of Industry, Trade and Tourism, based on the Fourth Industrial Revolution, Industry 4.0, which allows us to offer the market a new material with which to create unique environments and spaces.

Architectural Concrete

## Main advantages

Large size panels (up to 3975x1200mm, one of the largest sizes on the market)

that allow a facade design with more impressive, original and unique cuts.

- Bigger thickness that transmits a solid and robust image to the facade.
- Great resistance, thus avoiding breakage in low floors due to impacts.

Our innovative production system allows us to offer the market designs ranging from the most exclusive natural materials to products such as concrete, or faux concrete, which allows us to create contemporary environments and produce customized designs for projects that require it.

Premium finishes with the robustness, easy installation and durability of artificial stone, enhancing both thermal and acoustic performance. The value offered by GRACCO SURFACES allows designers to create environments hitherto reserved for only the most exclusive, luxury projects.

Years of research and development have led to a patent, a unique production process with which to offer a unique value proposition evolving in parallel to the needs of the 21st century, responding to the new needs of builders, architects and interior designers.

For the first time, on our projects we can draw on the magnificent technical characteristics of artificial stone, with finishes never seen before.
